

## Description

*The Northern prawn is a hermaphrodite and starts its life as a male; after 4-5 years it turns female.*

*The species is found mostly in areas with soft, muddy sediment where temperatures range from 1-6°C at a depth between 150 and 600 metres.*

*The prawns spawn in the autumn and the females carry the eggs until April/May when they hatch.*

This product comes from an MSC certified fishery.

<b>Commercial name</b>	Northern prawn
<b>Scientific name</b>	<i>Pandalus borealis*</i> and <i>Pandalus jordani**</i>
<b>Family</b>	Pandalidae
<b>Catch area</b>	*North West Atlantic / **North east Pacific
<b>Catch method</b>	Otter trawl
<b>Catch season</b>	April-October
